The cold and warm age-hardening of solution-treated and water-quenched aluminium-zinc and aluminium-zinc-copper alloys follows a simple law, if the criterion used is the time required to attain maximum hardness. In the binary system, age-hardened alloys with up to 83 at.-% aluminium (67 wt.-%) are the most stable at room temperature. Copper-bearing alloys of this type extend to about 75 at.-% (56 wt.-%) zinc. Binary alloys attain their maximum hardness during room temperature hardening, whereas copper-bearing alloys must be tempered. From the temperature-dependence of the age-hardening times, values were (Metallurgy TT, v. 5, no. 4) (over)

tension.

The surface tension of molten binary systems tin-zinc, aluminum-zinc, aluminum-magnesium and magnesium-zinc was determined by means of the bubble-pressure method. The selection of the systems permitted a comparison between the characteristics of molten systems with and without compound formations in the solid state; an interpretation of the molecular structure of molten metal alloys was attempted from the characterizing measuring effects.
